| | | Background and Rationale

ATTR Amyloidosis

- A progressive and fatal disease caused by accumulation of amyloid fibrils in multiple organs^{1–3}
- Ongoing TTR amyloid deposition in the heart drives the progression of CM, leading to: 1–3
 - Worsening HF and arrhythmias
 - Decline in functional status and QOL³⁻⁶

Patisiran

- IV-administered RNAi therapeutic approved for the treatment of ATTRv amyloidosis with polyneuropathy^{7–9}
- Prior clinical data in patients with ATTRv amyloidosis with polyneuropathy¹⁰ and a subgroup with ATTRv amyloidosis with evidence of cardiac amyloid involvement,¹¹ suggest the potential for patisiran to improve cardiac manifestations of ATTR amyloidosis

APOLLO-B Phase 3 Study in ATTR Amyloidosis with CM

• During the 12-month, double-blind period of the Phase 3 APOLLO-B study (NCT03997383), patisiran preserved functional capacity, health status, and QOL in patients with ATTR amyloidosis with CM, whereas placebo was associated with steady worsening¹²

| | Objective

- To evaluate disease progression in APOLLO-B patients following 12 months of treatment with patisiran vs placebo, based on the ESC expert consensus¹³ on monitoring patients with ATTR amyloidosis with CM every 6–12 months, using three domains:
 - Clinical and functional
 - Laboratory biomarker
 - Imaging and ECG

| | Methods

- Post hoc analysis of the Phase 3, double-blind, randomized APOLLO-B study assessing disease progression in patients with ATTRv or ATTRwt amyloidosis with CM after treatment with patisiran 0.3 mg/kg IV Q3W vs placebo IV Q3W for 12 months (Figure 1)
- Disease progression at 12 months was based on the ESC expert consensus on monitoring patients with ATTR amyloidosis with CM,¹³ using three domains: Clinical and functional, Laboratory biomarker, and Imaging and ECG (Figures 1 and 2)

Criteria for Disease Progression

• A patient met the criteria for overall disease progression if they fulfilled ≥1 criterion from each of the three domains at Month 12 (**Figure 2**) or the mortality criterion of death prior to the Month 12 visit

Statistical Analysis

- Patients meeting disease progression criteria are reported descriptively
- A Cochran–Mantel–Haenszel test stratified by baseline tafamidis use was used to obtain ORs with 95% CIs and p-values comparing treatments
- Patients with missing Month 12 data due to COVID-19 were excluded

| | Methods (cont'd)

Figure 1. Overall Study Design

Patient Population, N=360

- ATTR amyloidosis; wt or hereditary with any TTR variant
- Confirmed CM and medical history of symptomatic HF
- NYHA ≤III; minimum walk and NT-proBNP limits at baseline
- ≤30% on background tafamidis at baseline^a

Patisiran 0.3 mg/kg IV Q3Wb

or

Placebo
IV Q3Wb

Stratification:

Baseline tafamidis (yes or no); ATTRv vs ATTRwt amyloidosis; NYHA Class and age (NYHA Class I/II and age <75 years vs all other)

Patisiran vs Placebo at Month 12

Post hoc analysis of disease progression

 Evaluation of overall disease progression based on the ESC expert consensus on monitoring patients with ATTR amyloidosis with CM,¹³ using the following three domains^{c,d,e}:

Clinical and functional

Laboratory biomarker

Imaging and ECG

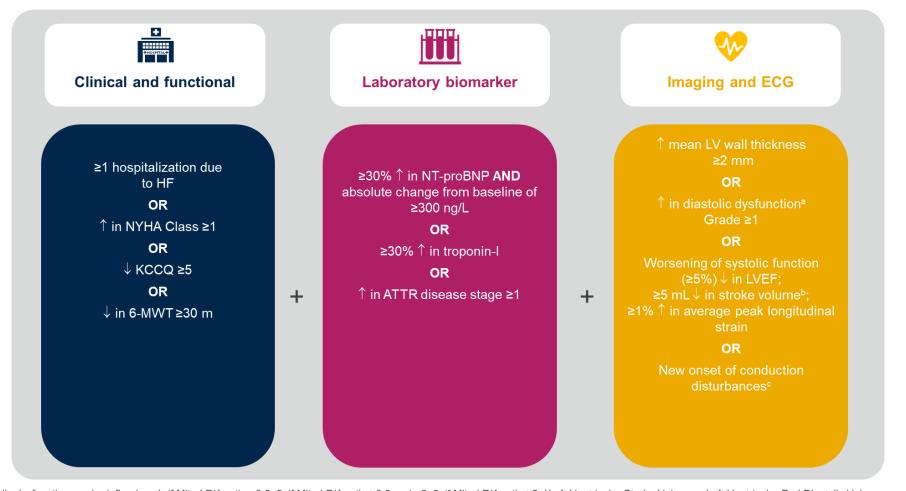

OR

Mortality criteria for disease progression, defined as death prior to Month 12

eWhere tafamidis is available as local standard of care; receiving tafamidis treatment for ≥6 months with disease progression in opinion of investigator. bTo reduce likelihood of infusion-related reactions, patients receive the following premedications or equivalent at least 60 minutes before each study drug infusion: dexamethasone; oral acetaminophen; H1 and H2 blockers. cDisease progression criteria were reported descriptively. A Cochran–Mantel–Haenszel test stratified by baseline tafamidis use was used to obtain ORs with 95% CIs and p-values comparing treatments. dPatients missing Month 12 data due to COVID-19 were excluded. eRecommended frequency of measurement for 3 domains of ESC criteria was 6-12-month timeframe, whereas this analysis was based on 12 months. ATTR, transthyretin-mediated; ATTRv, hereditary transthyretin-mediated (v for variant); ATTRwt, wild-type transthyretin-mediated; CI, confidence interval; CM, cardiomyopathy; ESC, electrocardiography; ESC, European Society of Cardiology; HF, heart failure; IV, intravenous; NT-proBNP, N-terminal prohormone of B-type natriuretic peptide; NYHA, New York Heart Association; OR, odds ratio; Q3W, once every 3 weeks; TTR, transthyretin; wt, wild-type. 13. | | | Methods (cont'd)

Figure 2. ESC Criteria for Disease Progression at Month 12¹³

^aDiastolic dysfunction grade defined as 1, if Mitral E/A ratio <0.8; 2, if Mitral E/A ratio ≥0.8 and <2; 3, if Mitral E/A ratio ≥2. ^bLeft Ventricular Stroke Volume = Left Ventricular End Diastolic Volume. ^cConduction disturbance was defined as an AE with an onset date after randomization and before Month 12 visit with any of the following preferred terms: Cardiac pacemaker insertion; cardiac resynchronization therapy; implantable defibrillator insertion; atrioventricular block; atrioventricular block complete; atrioventricular block first degree; atrioventricular block second degree; bundle branch block left; bundle branch block right; conduction disorder; bradycardia; chronotropic incompetence; sinus arrest; sinus disorder; sinus bradycardia; or sinus node dysfunction. 6-MWT, 6-minute walk test; AE, adverse event; ATTR, transthyretin-mediated; ECG, electrocardiography; ESC, European Society of Cardiology; HF, heart failure; KCCQ, Kansas City Cardiomyopathy Questionnaire; LV, left ventricular; LVEF, left ventricular ejection fraction; NT-proBNP, N-terminal prohormone of B-type natriuretic peptide; NYHA, New York Heart Association. 13. Garcia-Pavia et al. *Eur J Heart Fail* 2021;23:895–905.

| | | Baseline Demographic and Disease Characteristics

- Baseline demographics and disease characteristics were comparable between the patisiran (n=181) and placebo (n=178) arms (Table 1)
- The majority of patients were White (79%) and male (89%) with ATTRwt amyloidosis (80%) and were in ATTR amyloidosis stage I (68%) and NYHA Class II (85%) (Table 1)

Table 1. Baseline Characteristics

Characteristic	Patisiran (N=181)	Placebo (N=178)
Age, median (range), years	76 (47–85)	76 (41–85)
Male sex, n (%)	161 (89)	160 (90)
Race, n (%) ^a		
White	138 (76)	140 (79)
Asian	23 (13)	15 (8)
Black or African American	16 (9)	15 (8)
ATTRwt amyloidosis, n (%)	144 (80)	144 (81)
Time since diagnosis of ATTR amyloidosis, median (range), years	0.8 (0–6)	0.4 (0–10)
Baseline tafamidis use, n (%)	46 (25)	45 (25)
NYHA Class, n (%)		
Class I	10 (6)	15 (8)
Class II	156 (86)	150 (84)
Class III	15 (8)	13 (7)

Characteristic	Patisiran (N=181)	Placebo (N=178)
ATTR amyloidosis stage ^b , n (%)		
Stage 1	124 (69)	120 (67)
Stage 2	46 (25)	45 (25)
Stage 3	11 (6)	13 (7)
PND score, n (%)		
0: no impairment	96 (53)	109 (61)
I: preserved walking, with sensory disturbances	63 (35)	55 (31)
II: impaired walking without need for a stick or crutches	22 (12)	14 (8)
6-MWT, m, median (IQR)	358.0 (295.0–420.0)	367.7 (300.0–444.3)
KCCQ-OS, points, mean (SD)	69.8 (21.2)	70.3 (20.7)
NT-proBNP level, ng/L, median (IQR)	2008 (1135–2921)	1813 (952–3079)
High-sensitivity troponin-I level, ng/L, median (IQR)	64.0 (38.6–92.0) ^c	60.2 (38.2–103.1) ^d
eGFR, mL/min/1.73 m ² , median (IQR)	71.0 (58.0–83.0)	67.0 (51.0–84.0)

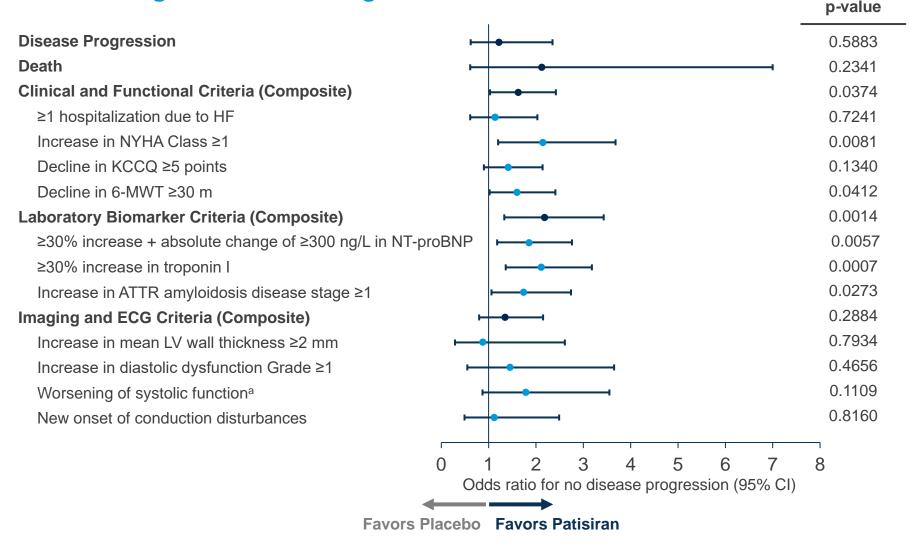

^aPatisiran n=180; placebo n=174. ^bGillmore staging was used. Patients are stratified into prognostic categories using the serum biomarkers NT-proBNP and eGFR. Patients are categorized as follows: stage 1 (lower risk): NT-proBNP ≤3000 ng/L and eGFR ≥45 mL/min/1.73 m²; stage 2 (intermediate risk): all other patients not meeting criteria for stages 1 or 3; stage 3 (higher risk): NT-proBNP >3000 ng/L and eGFR <45 mL/min/1.73 m². ^cn=174. ^dn=172. 6-MWT, 6-minute walk test; ATTR, transthyretin-mediated; ATTRwt, wild-type transthyretin-mediated; eGFR, estimated glomerular filtration rate; IQR, interquartile range; KCCQ-OS, Kansas City Cardiomyopathy Questionnaire-Overall Summary; NT-proBNP, N-terminal prohormone of B-type natriuretic peptide; NYHA, New York Heart Association: PND, polyneuropathy disability score; SD, standard deviation.

| | Disease Progression According to ESC Criteria

- This post hoc analysis included 180 and 178 patients in the patisiran and placebo arms, respectively
- At Month 12, treatment with patisiran improved the odds of no disease progression vs placebo (OR 1.2; 95% CI 0.62–2.35) (**Figure 3**)
- Patisiran demonstrated benefits vs placebo in the clinical and functional (odds of no disease progression vs placebo: OR 1.58; 95% CI 1.03–2.42) and laboratory biomarker (OR 2.14; 95% CI 1.33–3.43) criteria domains (**Figure 3**)
- Patisiran demonstrated a favorable trend in the imaging and ECG criteria domain (odds of no disease progression vs placebo: OR 1.31; 95% CI 0.80–2.15) (**Figure 3**)

| | Disease Progression According to ESC Criteria (cont'd)

Figure 3. Disease Progression According to ESC Criteria

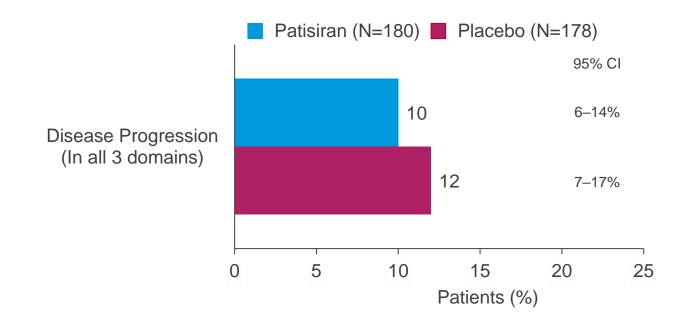

^aDefined as decrease in LVEF ≥5%, decrease in stroke volume ≥5 mL, and ≥1% increase in average peak longitudinal strain. 6-MWT, 6-minute walk test; ATTR, transthyretin-mediated; CI, confidence interval; ECG, electrocardiography; ESC, European Society of Cardiology; HF, heart failure; KCCQ, Kansas City Cardiomyopathy Questionnaire; LV, left ventricular; LVEF, left ventricular ejection fraction: NT-proBNP, N-terminal prohormone of B-type natriuretic peptide: NYHA, New York Heart Association.

| | Disease Progression According to ESC Criteria (cont'd)

- A lower proportion of patients receiving patisiran vs placebo met the disease progression criteria across all 3 domains (Figure 4)
 - In the patisiran and placebo arms, respectively, 56% vs 67% of patients had disease progression according to the clinical and functional criteria, 52% vs 68% according to the laboratory biomarker criteria, and 21% vs 25% according to the imaging and ECG criteria

Figure 4. Percentage of Patients with Disease Progression in All Three Domains^a

^aThe three ESC expert consensus domains are Clinical and Functional, Laboratory Biomarker, and Imaging and ECG. CI, confidence interval; ECG, electrocardiography; ESC, European Society of Cardiology.

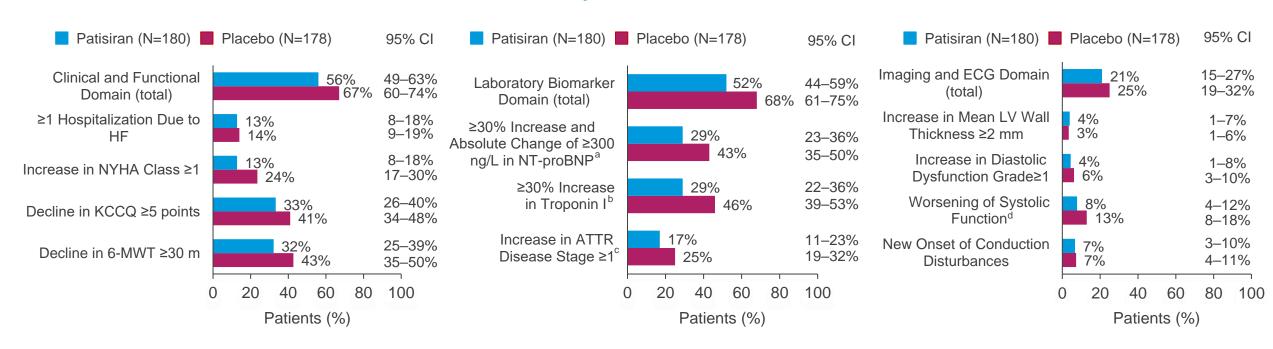

| | Disease Progression According to ESC Criteria (cont'd)

- A numerically lower proportion of patients receiving patisiran vs placebo had disease progression according to all subcriteria in each of the 3 domains (**Figure 5a,b,c**) apart from 2 of the imaging and ECG criteria (**Figure 5c**)
- Approximately 25% of patients who experienced disease progression after receiving placebo also reported worsening in NYHA class, compared with 13% of patients receiving patisiran (**Figure 5a**)

Figure 5a. Percentages of Patients with Disease Progression by Clinical and Functional Criteria

Figure 5b. Percentages of Patients with Disease Progression by Laboratory Biomarker Criteria

Figure 5c. Percentages of Patients with Disease Progression by Imaging and ECG Criteria

^aData missing for 13 and 15 patients in the patisiran and placebo arms, respectively. ^bData missing for 22 and 23 patients in the patisiran and placebo arms, respectively. ^aDefined as decrease in LVEF ≥5%, decrease in stroke volume ≥5 mL, and ≥1% increase in average peak longitudinal strain. 6-MWT, 6-minute walk test; ATTR, transthyretin-mediated; CI, confidence interval; ECG, electrocardiography; ESC, European Society of Cardiology; HF, heart failure; KCCQ, Kansas City Cardiomyopathy Questionnaire; LV, left ventricular; LVEF, left ventricular ejection fraction; NT-proBNP, N-terminal prohormone of B-type natriuretic peptide; NYHA, New York Heart Association.

∥Safety

- Overall safety is shown in Table 2
- The majority of AEs were mild or moderate in severity
- The frequency of severe and serious adverse events was similar between groups (Table 2)
- AEs occurring in ≥5% of patisiran-treated patients and more frequently (≥3%) in the patisiran group included IRRs (12% vs 9%), arthralgia (8% vs 4%), and muscle spasms (7% vs 2%)
- Serious AEs reported in ≥2% of patients in the patisiran and placebo groups, respectively, were cardiac failure (8% vs 7%), atrial fibrillation (3% vs 2%), and atrioventricular block complete, amyloidosis, and syncope (each in 1% vs 2% of patients)
- None of the deaths reported were considered related to study drug

Table 2. Overall Safety Profile

≥1 Event, n (%)	Patisiran N=181	Placebo N=178
AEs	165 (91)	168 (94)
Serious AEs	61 (34)	63 (35)
Severe AEs	47 (26)	52 (29)
Cardiac AEsa	82 (45)	100 (56)
Cardiac serious AEsa	32 (18)	28 (16)
AEs leading to study drug discontinuation	5 (3)	5 (3)
Deaths ^b	5 (3)	8 (4)

| | Conclusions

- Fewer patisiran-treated patients in APOLLO-B had evidence of disease progression vs placebo at Month 12, based on the 2021 ESC Expert Consensus on the Monitoring of Transthyretin Amyloid Cardiomyopathy
- The risk of disease progression was lower at Month 12 with patisiran vs placebo by Clinical and Functional and Laboratory Biomarker composite criteria, and trended lower by Imaging and ECG criteria from the ESC consensus
- By NYHA class and ATTR amyloidosis disease stage (Gillmore), the risk of disease progression was lower in patisiran- than placebo-treated patients
- Patisiran demonstrated an acceptable safety profile, including no cardiac safety concerns
- Long-term follow-up will further assess the impact of patisiran in patients with ATTR amyloidosis with CM
